MPL Assignment - 2

Define progressive webApp (PWA) and explain its significance in modern web development. Discuss the key characteristics that differentiate PWA's from traditional mobile apps

A progressive webApp (PWA) is a type of web application that works like a mobile app but runs in browser. It can be installed on a device works offline and provides a fast and a smooth user experience.

Significance of PWA in modern web development

- Cross platform compatibility
- offline support
- fast performance
- No app store required
- lower development cost

Key difference between PWA & traditional mobile App

| Features | PWA | Traditional Mobile Apps |
|-------------------|--------------------------------|-------------------------------|
| Installation | Direct from browser | Download from App Store |
| Internet Required | works offline with caching | Usually requires internet |
| Performance | fast with service workers | faster but needs installation |
| Updates | Automatic no appstore approval | manual update needs |
| Development cost | Lower | Higher |

Q2) Define responsiveness web design and explain its importance in the context of progressive webApps compare and contrast responsiveness fluid & adaptive web design approaches

→ Responsive web design (RWD) is technique that makes web pages adjust automatically to different screen sizes and devices. It ensure a good user experience on mobiles, tablets and desktops without needing separate version of website.

* Importance of responsiveness design in PWA.

- Better user experience - PWA work smoothly on any device
- faster load time - optimised design improves speed
- SEO benefits - Google ranks responsive sites higher
- Cost effective - No need to build multiple version for different screens.

* Comparison of web design approaches

| Approach | How it work | Pos | Cons. |
|------------------|--|--|---|
| - Responsiveness | Uses flexible grids and CSS media queries to adjust layout | works on cell devices | Can be complex to design |
| - Fluid | Uses parent based widths instead of fixed pixels so elements resize smoothly | works well on diff screen sizes, easy to implement | less control over layout on large screens |
| - Adaptive | Uses fixed layouts that change at specific breakpoints | optimized for known screen sizes | more efficient required to design for each screen size. |

Key differences

- Responsive Adapts dynamically to all screens.
- Fluid resizes - smoothly, but may be fully & prioritised
- Adaptive loads different layouts based on device types.

Describe the lifecycle of service workers including to registration, installation and activation phase
Lifecycle of service workers.

A service worker is a script that runs in background and helps a web app work offline load faster and send push notification. Its lifecycle has three main phases.

Registration Phase

The browser registers the service worker using Javascript.
Code Eg:-

```
if ('serviceWorker' in navigator) {  
    navigator.serviceWorker.register('/sw.js')  
    .then(() => console.log('service worker registered'))  
    .catch(error => console.log('Registration failed', error))  
}
```

This tells the browser to install and activate the service worker.

Installation phase

The service worker downloads necessary files (HTML, CSS, JS) and stores them in cache.

If successful it moves to activation phase.

Eg:
self.addEventListener('install', event => {
 event.waitUntil(

• caches open (app-cache) then (cache → &
 return cache add API ['Index.html', 'styles.css']
 4)
 4;
 3;

This ensure the app load even without internet.

3) Activation phase

- The old service worker is replaced with new one.
- Unused cache files from the previous version are deleted.

Final step fetch & sync

Once activated the service worker intercepts network requests serves cached files and sync data when the Internet is available. This lifecycle make PWA's faster, more reliable and capable of working offline.

Q4) Explain the use of Indexed DB in the system service worker of data storage

Ans Use of Indexed DB in service worker for data storage
 Indexed DB is a browser database that stores large amounts of structured data like json objects. It helps PWA's work offline by saving and retrieving data efficiently.
 Why use Indexed DB in service worker?

- 1) Offline Support - stores data when offline and sync is later.
- 2) Efficient storage - saves structured data like user settings, list items or forms inputs.
- 3) Faster Access - Retrieves data quickly without needing a network request.

Persistent Data - Data remains saved even after the browser is closed.

How service workers uses Indexed DB?

Opening the database

```
let db;
```

```
let request = indexedDB.open('My database');
```

```
request.onsuccess = function(event) {
```

```
  db = event.target.result;
```

```
};
```

Creating a store & Adding data.

```
request.onsuccess = function(event) {
```

```
  let db = event.target.result;
```

```
  let store = db.createObjectStore('users' & {keypath: 'id'});
```

```
  store.add({id: 1, name: 'John Doe', age: 25});
```

```
};
```

Fetching data in service worker.

```
let transaction = db.transaction('users' & {readonly: true});
```

```
let store = transaction.objectStore('users');
```

```
let user = store.get(1);
```

```
getusers.onsuccess = function() {
```

```
  console.log('get user detail');
```

```
};
```
